Project Name	Machine Learning—Based Credit Card Approval Prediction System
Maximum Marks	4 Marks

Proposed Solution

Introduction The proposed solution is a Machine Learning—Based Credit Card Approval Prediction System that automates the evaluation Of credit card applications using historical financial data and predictive analytics. The system minimizes manual intervention by accurately clmssifying applicants as eligible or ineligible for credit card approval. A web-based application built using Flzusk provides an intuitive interface for applicants and administrators, while Machine Learning models deliver fast, consistent, and reliable predictions.

Key Featmæs of the Proposed Solution

Feature		Description
1.	Secure User Authentication	Allows applicants and administrators to legister and log in sectnely using authenticated credentials.
2.	Applicant Data Collection	Collects personal, employment, financial, and credit-lated information through an intuitive web interface.
3.	Preproce«ng	Handles rniKsing values, encexles categorical variables, validates user inputs, and prepares data for Machine L.æarning prediction.
4.	rvlæhiæ Learning Prediction	Uses trained classification ruxkls such as Regression, Ihision TIW, Random Forest, and X'GBex»st to predict ctedit card approval.
5.	Plediction Result	Displays the apploval or rejection result instantly along with the predicted eligibility status.
6.	Pruliction History	Stores applicant details and prediction outcomes securely for future reference and administrative analysis.

7.	Administrative Dashboard	Allows administrator to review prediction records, monitor application activity, and generate reports.
----	--------------------------	--

Advantages Of the I-imposed Solution

Automates credit card approval prediction.
Reduces manual processing time.

- Improves prediction accuracy.
 - Supports secure applicant data management
 - Ensures consistent decision-making.
 - Enhances customer experience.
 - Provides scalable web-based deployment
 - Enables future Machine Learning improvements.

Conclusion proposed Machine Learning—Based Credit Approval Prediction System integrates modern web technologies with advanced Machine learning algorithms to automate the credit approval process. "The solution improves decision accuracy, reduces Operational workload, enhances customer satisfaction, strengthens data security, and provides a scalable platform suitable for deployment in real-world banking environments.
